

SEIFELDIN SABRY

SOFTWARE ENGINEER

seif-dx@proton.me · +32 468 29 52 40 · LinkedIn · GitHub · Portfolio

ABOUT

As a software engineer and founder, I build reliable products and the systems behind them - from type-safe monorepos and event-driven infrastructure to billing, onboarding, and automation that holds up in production. Outside of work, I like to travel, play tennis, spend time in the gym, and take long walks with a 20 kg weighted vest. I also hold a driver's licence.

PROFESSIONAL EXPERIENCE

Software Engineer | QFacts

July 2025 - Present

Stack: TypeScript, NestJS, React, PostgreSQL, Stripe, GCP, Pulumi

- Led the migration of qfacts-api and qfacts-app from separate repositories into a type-safe pnpm/Turborepo monorepo. Established a generated shared TypeScript SDK, shared runtime configuration, workspace-aware CI, and integrated Pulumi infrastructure, reducing cross-repository type drift and keeping API, app, and infrastructure changes aligned.
- Owned infrastructure across Cloud Run, Pub/Sub, Eventarc, Cloud SQL, GCS, and Secret Manager; introduced reproducible infrastructure-as-code deployments, failed-revision recovery, and image-layer caching to improve rollout safety and deployment reliability.
- Architected Stripe billing end to end, including self-serve signup, 7-day trials, hosted checkout, volume-tiered seat pricing, grace periods, dunning, and reactivation. Hardened provisioning with Stripe idempotency keys, organisation-scoped locks, atomic writes, duplicate reconciliation, and webhook catch-up to protect revenue flows from race conditions and duplicate subscriptions.
- Replaced inline email side effects with persistence-aware domain events across 14 business events and 24 listener flows; fixed silently dropped training emails and decoupled core product workflows from notification delivery.
- Led a cross-cutting technical-debt reduction initiative: eliminated 14 circular dependencies, removed MikroORM anti-patterns and N+1 queries, hardened tenant-scoped RBAC, and strengthened regression coverage with 460+ API integration tests and 13 Playwright suites. This reduced change risk and made future feature delivery safer across the monorepo.
- Rebuilt enterprise onboarding and learning workflows: delivered a 12-step bulk CSV import platform, removed 9,000 lines of legacy code, and shipped XState-driven E-learning with automatic grading, retake cooldowns, electronic signatures, and audit trails.

Software Engineer | Etoile

May 2025 - April 2026

Stack: Python, PostgreSQL, Docker, GitHub Actions, TypeScript, Next.js

- Architected and delivered a production backend for an AI-native event platform, establishing modular APIs, secure authentication, and role-based access for multi-organisation workflows.
- Established CI/CD with automated testing and quality gates, turning releases into repeatable, reviewable deployments; integrated storage, notifications, and analytics services.

CORE TECHNOLOGIES

- Languages: TypeScript/JavaScript, Python, Java, SQL, Bash
- Backend: Node.js, NestJS, PostgreSQL, MikroORM, REST/OpenAPI, Stripe
- Frontend: React, Next.js, Vite, React Query, Zustand, Playwright
- Cloud and Delivery: GCP, Cloud Run, Cloud SQL, Pub/Sub, Eventarc, GCS, Secret Manager, Pulumi, Docker, GitHub Actions
- Architecture: Multi-tenancy, event-driven systems, idempotency, RBAC, state machines, CI/CD, integration testing

AI-ASSISTED ENGINEERING

I use Codex, Claude, and open-source models with coding harnesses and automated workflows, continuously experimenting with new ways to move from idea to tested implementation.

EDUCATION

Degree	Institute	Year
B.ASc	Karel de Grote Hogeschool	2021-2024
