Seifeldin Sabry

Senior Software Engineer | TypeScript, Platform & DevOps (GCP, Pulumi)

Belgium | +32 468 29 52 40 | seif-dx@proton.me | linkedin.com/in/seifeldin-sabry | github.com/Seifeldin-Sabry

Summary

TypeScript engineer who owns production systems end to end: NestJS and Node.js backends, React frontends, infrastructure as code with Pulumi on Google Cloud, CI/CD and releases. At QFacts, a multi-tenant SaaS for regulated quality management, I am the main engineer on the platform. I led the move to a TypeScript monorepo, built Stripe billing from scratch, and proposed and shipped the super-admin console and the company's new marketing site and CMS.

Experience

QFacts **Jul 2025 – Present**

Software Engineer, Platform & Infrastructure Owner *Belgium*

- **Became the go-to owner of the whole platform** (API, web app, infrastructure and marketing site) by taking features from architecture and design through delivery, releases and production support.
- **Ended type drift between API, app and infrastructure, so a contract change now ships in one pull request,** by leading the move from two repositories to a pnpm/Turborepo TypeScript monorepo with an OpenAPI-generated SDK, drift checks in CI and path-filtered GitHub Actions.
- **Made deploys reproducible and recoverable across staging, UAT and production** by owning GCP infrastructure as code in Pulumi (Cloud Run, Cloud SQL, Pub/Sub, Eventarc, Cloud Storage, Secret Manager, IAM), with failed-revision recovery, image-layer caching and gated releases.
- **Let customers sign up and pay without sales involvement, with no duplicate charges,** by building Stripe billing from scratch: self-serve signup, trials, hosted checkout, volume-tiered seat pricing, dunning and reactivation, protected by idempotency keys, organisation-scoped locks and webhook reconciliation.
- **Removed manual database work from client onboarding and support** by proposing and building a super-admin console for organisations, data migrations, version recovery, signed operations and background jobs, all recorded in an append-only audit trail.
- **Let marketing publish without engineers and gave the company ownership of its site** by moving it off Wix, on my own initiative, to Next.js on Cloud Run with a self-hosted Strapi CMS, technical SEO, multi-language pages and PostHog analytics.
- **Restored production data during a real incident** by setting up structured logging, Sentry, Cloud Monitoring alerts as code and a point-in-time recovery runbook.
- **Stopped emails being dropped silently and met enterprise security needs** by replacing inline side effects with domain events and listeners, and by adding Microsoft SSO for each tenant and a database-enforced append-only audit log.
- **Made the codebase safer and faster to change** by removing circular dependencies and N+1 queries, hardening tenant-scoped RBAC, building integration and Playwright E2E coverage, and replacing legacy onboarding with a 12-step bulk import.
- **Cut time spent searching and drafting, and helped auditors and workers spot recurring issues early,** by delivering an AI assistant with RAG over each customer's documents, brainstorming and similarity checks across quality events, with human review and evaluation experiments.
- **Made the product easier to learn and usable on the shop floor** by leading the UI modernisation and mobile companion: one list, filter and export pattern on every page, clearer detail pages and phone layouts.
- **Shipped 1.4.0 to production safely** by running the release-candidate and UAT hotfix cycle.

Etoile **May 2025 – Apr 2026**

Software Engineer (concurrent role) *Remote*

- **Took an AI-native event platform to production** by designing and building its backend: modular APIs, secure authentication and role-based access for multiple organisations, with storage, notifications and analytics integrated.
- **Made releases repeatable and reviewable** by setting up CI/CD from scratch with automated tests and quality gates.

Technical Skills

Languages: TypeScript, JavaScript, Python, SQL, Bash, Java
Backend: Node.js, NestJS, Express, REST, OpenAPI, PostgreSQL, MikroORM, Kysely, Stripe, XState
Frontend: React, Next.js, Vite, React Query, Zustand, Tailwind CSS, Playwright, Vitest
Cloud & DevOps: Google Cloud Platform (GCP), Cloud Run, Cloud SQL, Pub/Sub, Eventarc, IAM, Pulumi, Infrastructure as Code (IaC), Docker, GitHub Actions, CI/CD, Turborepo, pnpm
Observability: Sentry, Cloud Monitoring, structured logging, PostHog
Architecture: Multi-tenant SaaS, event-driven systems, idempotency, RBAC, SSO/OAuth, monorepos, Strapi CMS, SEO

Education

Karel de Grote Hogeschool **2021 – 2024**

Bachelor of Applied Computer Science *Antwerp, Belgium*
